

Thought Process – How AI Was Integrated Into Our Workflow

We used AI as a **learning, debugging, and development assistant**. Our approach was to first understand the problem ourselves, break it into smaller components, and then use AI whenever we needed clarification, implementation guidance, or verification.

The overall development process was:

AI was mainly used at the points where we needed to understand a concept more deeply, verify whether our approach was correct, or troubleshoot an implementation issue. This allowed us to use AI for difficult implementation and debugging tasks while still maintaining understanding and control over the final system.
